POT

This is documentation of POT - official toolkit for [OTServ AAC scripts](#).

PHP OTServ Toolkit

There are several reasons why POT was created:

- Just because it was needed - OTServ should have had that long time ago.
- To unify AAC scripts - there are tons of them, and you never know how to write even a single line of code to them as each of them are created different way.
- To provide reliable way of database accessing - most of people who create AAC scripts are (to be honest...) idiots - they don't know what PHP is, how to use it, they just "want to make own AAC script".
- To provide easy interface - people who write in PHP want to write in PHP, not using SQL, XML and many other languages. POT provides abstract PHP interface for data stored in database.

POT has been created for latest SVN release, it won't work with old database structure as well as with broken database - it relies on database foreign key constraints, triggers etc.

System requirements

To use POT you need [PHP](#) version at least 5.0 with [PDO extension installed](#) (so it means you will mostly need PHP 5.1, but it is possible to download PDO as external libraries for PHP 5.0.x).

What POT is

POT is a toolkit/library for accessing OTServ database from PHP. It provides PHP classes that represents OTServ database information as an objects.

What POT is not

- It is not AAC script - this is a toolkit for making them, but you can't directly run it as website. It has only programming interface.
- It is not application/system framework - you won't create website with only POT. POT has only functionality connected with OTServ database, it doesn't contain for example templates engine. You also won't be able to use it as an ordinary database connection engine - it makes use of [PDO](#) so you can use PDO by itself, POT doesn't provide any additional universal functionality. All it's classes are strictly connected with OTServ database.

What about XML?

Sorry to say, XML guys - go out. OTServ will never leave XML - it is good to store some flat parts of database there. But not for main database which requires more advanced relationship between data. However of course maybe someone would want to create DB_XML driver for POT? If you really are a masochist - you're welcome, we will be glad to contribute with you ;).

If you are interested in why XML so sux, and you with it, check out [OTFans thread](#).

How to use

This is toolkit - set of classes/methods for OTServ database. It abstracts database mechanisms for you so you can work on "physical" PHP objects. But you must know how to use them. This documentation describes some basic steps and toolkit API, but you must know PHP in order to make use of them - the best place to get some knowledge is [PHP manual](#).

Don't copy any of included examples, neither codes provided as examples - they probably won't work. Mainly it's because you have to put your database configuration into them and your script paths. But it's not enough. If you have your own `__autoload()` mechanism you won't be able to just include example codes - you would need to redefine `__autoload()` function, which PHP doesn't allow to (but you should know that very well). Example codes are examples - write your own (if you want them to work the best way for you).

Link

If you use POT in your script and want to show that you can put this image on your website:

You can use following code for that:

```

2 
3 </a>
```

POT class preview

Here main POT class will be described in more guided way.

What it is

[POT](#) class is main class of this toolkit. You will access any other classes using this one. It creates for you instances of other classes when you call it's methods and handles class files loading.

Creating instance of POT class

To get POT object you have to use [POT::getInstance\(\)](#) static method. You should never ever create POT class instances directly! [POT::getInstance\(\)](#) will save static instance and return it globally so you won't need to re-create instances of this class. It is important, as object of this class contains another resources like database connection, or classes directory path so after creating new instance it would not contain them from previous one.

__autoload() and POT classes

PHP5 provides nice [autoloading mechanism](#). You can combine [POT class loading mechanism](#) with it. For example:

```
1  <?php
2
3  /**
4   * @ignore
5   * @package examples
6   * @author Wrzasq <wrzasq@gmail.com>
7   * @copyright 2007 (C) by Wrzasq
8   * @license http://www.gnu.org/licenses/lgpl-3.0.txt GNU Lesser General Public License, Version 3
9   */
10
11 // includes POT main file
12 include( './classes/OTS.php' );
13
14 function __autoload( $class )
15 {
16     // checks if it's POT class
17     if( preg_match( '/^OTS_/', $class ) != 0 )
18     {
19         POT::getInstance\(\)-> loadClass( $class );
20     }
21 }
22 // possibly call your own __autoload() handler
23 else
24 {
25     here comes your stuff...
26 }
27 */
28 }
29
30 ?>
```

DAO classes

Key part of this toolbox are Data Access Objects which provides abstraction layer in PHP for plain database data. You create them via main POT class using [createObject\(\) method](#).

Quick start

Quick start guide.

Putting this all together

To set POT up for using you have to create it's instance and connect to database (we also encourage you to bind [POT classes loading mechanism](#) to `__autoload()` function. Here is a startup code example:

```
1  <?php
2
3  /**
4   * @ignore
5   * @package examples
6   * @author Wrzasq <wrzasq@gmail.com>
7   * @copyright 2007 (C) by Wrzasq
8   * @license http://www.gnu.org/licenses/lgpl-3.0.txt GNU Lesser General Public License, Version 3
9   */
10
11 // includes POT main file
12 include('..classes/OTS.php');
13
14 // for further POT classes
15 function __autoload($class)
16 {
17     // checks if it's POT class
18     if (preg_match('/^?OTS_', $class) != 0)
19     {
20         POT::getInstance()-> loadClass( $class);
21     }
22 }
23 // possibly call your own __autoload() handler
24 else
25 {
26     here comes your stuff...
27 }
28 */
29 }
30
31 // database configuration - can be simply moved to external file, eg. config.php
32 $config= array(
33     'driver' => POT::DB_MYSQL,
34     'host' => 'localhost',
35     'user' => 'wrzasq',
36     'database' => 'otserv'
37 );
38
39 // creates POT instance (or get existing one)
40 $ots= POT::getInstance();
41 $ots-> connect(null, $config;
42
43 ?>
```

Account creation

It is very simple to create account with POT. Here is example code that is self-explainable:

```
1  <?php
2
3  /**
4   * @ignore
5   * @package examples
6   * @author Wrzasq <wrzasq@gmail.com>
7   * @copyright 2007 (C) by Wrzasq
8   * @license http://www.gnu.org/licenses/lgpl-3.0.txt GNU Lesser General Public License, Version 3
9   */
10
11 // to not repeat all that stuff
12 include('quickstart.php');
13
14 // creates new OTS_Account object
15 $account= $ots-> createObject('Account');
16
17 // generates new account number
18 $number= $account-> create();
19
20 /*
21 to generate number from 111111 to 999999 use:
22 $number = $account->create(111111, 999999);
23 */
24
25 // sets account info
26 $account-> setPassword('secret');// $account->setPassword( md5('secret') );
27 $account-> setEmail('foo@example.com');
28 $account-> unblock();// remember to unblock!
29 $account-> setPACCDays(0);
30 $account-> save();
31
32 // give user his number
33 echo 'Your account number is: ', $number
34
35 ?>
```

It is important to remember that [create\(\) method](#) sets `blocked` field of record to true by default, so for smaller projects where you, for example, wouldn't need e-mail activation unblock it after creation.

Character reading

Here comes also simple example for character search:

```
1  <?php
2
3  /**
4   * @ignore
5   * @package examples
6   * @author Wrzasq <wrzasq@gmail.com>
7   * @copyright 2007 (C) by Wrzasq
8   * @license http://www.gnu.org/licenses/lgpl-3.0.txt GNU Lesser General Public License, Version 3
9   */
10
11 // to not repeat all that stuff
```

```

12 include('quickstart.php');
13
14 // creates new OTS_Player object
15 $player= $ots-> createObject('Player');
16
17 // loads player
18 $player-> find('Wrzasq');
19
20 // checks if player exists
21 if( $player-> isLoaded() )
22 {
23     // prints character info
24     echo 'Player \' . $player-> getName() . '\' has ' . $player-> getLevel() . ' level.', "\n" ;
25
26     // example of associated objects retrieving
27     echo 'Player \' . $player-> getName() . '\' is member of ' . $player-> getGroup()-> getName() . '
group.', "\n" ;
28 }
29 else
30 {
31     echo 'Player does not exists.', "\n" ;
32 }
33
34 ?>

```

Objects listings

There are also classes for entire sets of records. For each of row classes there is list class. Through list object you can read single objects and/or delete them from database. Also you can set limitation (for example for pagination). All list classes implements Countable and Iterator interfaces:

```

1 <?php
2
3 /**
4  * @ignore
5  * @package examples
6  * @author Wrzasq <wrzasq@gmail.com>
7  * @copyright 2007 (C) by Wrzasq
8  * @license http://www.gnu.org/licenses/lgpl-3.0.txt GNU Lesser General Public License, Version 3
9  */
10
11 // to not repeat all that stuff
12 include('quickstart.php');
13
14 // creates new OTS_Player object
15 $players= $ots-> createObject('Players_List');
16
17 // count of all players - Countable interface implemented
18 echo 'There are ' . count( $players ) . ' players in our database.', "\n" ;
19
20 // sets limitation
21 $players-> setLimit(10);
22 $players-> setOffset(2);
23
24 // iterates through selected players
25 foreach( $players as $index=> $player)
26 {
27     // each returned item is instance of OTS_Player class
28     echo (2 + $index) . ': ' . $player-> getName(), "\n" ;

```

```
29 }  
30  
31 ?>
```

Account number hack

Example code of how to use prepared account number instead of random.

Walkaround

POT always generates random account number - [it is the way your script should work](#). It is done that way with premeditation. However you can walk around it with simple code:

```
1  <?php
2
3  /**
4   * @ignore
5   * @package examples
6   * @author Wrzasq <wrzasq@gmail.com>
7   * @copyright 2007 (C) by Wrzasq
8   * @license http://www.gnu.org/licenses/lgpl-3.0.txt GNU Lesser General Public License, Version 3
9   */
10
11 // to not repeat all that stuff
12 include('quickstart.php');
13
14 // your non-random number
15 $number= 123456;
16
17 // creates new OTS_Account object
18 $account= $ots->createObject('Account');
19 $account->load($number);
20
21 // number is busy
22 if( $account->isLoaded() )
23 {
24     echo 'Account number ', $number, 'is used.', "\n" ;
25 }
26 // it is not
27 else
28 {
29     // generate number from exactly $number - $number range
30     $number= $account->create($number, $number);
31     echo 'Your account number is: ', $number, "\n" ;
32 }
33
34 ?>
```

```

Function Parameters:

- *int|null* **\$driver** Database driver type.
- *array* **\$params** Connection info.

Connects to database.

Connects to database.

Creates OTServ database connection object.

First parameter is one of database driver constants values. Currently MySQL and SQLite drivers are supported. XML is not planned.

This parameter can be null, then you have to specify 'driver' parameter.

Such way is comfortable to store entire database configuration in one array and possibly runtime evaluation and/or configuration file saving.

For parameters list see driver documentation. Common parameters for all drivers are:

- *driver* - optional, specifies driver, applies when *\$driver* method parameter is *null*
- *prefix* - optional, prefix for database tables, use if you have more than one OTServ installed on one database.

- **Version** 0.0.1
- **Throws** Exception When driver is not supported.

INSTALL

POT is a toolkit which means you don't literally install it. You copy it's files and write code for it. All source files are located in classes/ subdirectory. Copy them to your script directory.

You can put main file - OTS.php in different directory then other files.

For information about how to include POT in your code see the documentation.

README

POT (PHP OTServ Toolkit) is a PHP toolkit for scripts that work with OTServ database.

===== About =====

This toolkit provides a way for PHP programmers that don't know SQL language to work with OTServ database.

For installation help check INSTALL file.

For usage tutorial/API documentation check [documentation/index.html](#) or [documentation.pdf](#) files.

phpunit: PHPUnit testing framework.

Possible targets:

all: default one, runs all other targets (in order: clean, check, documentation, pdf, otserv-aac, test).
clean: deletes documentation.
check: checks syntax of all PHP files.
documentation: generates HTML documentation.
pdf: generates PDF documentation.
otserv-aac: OTServ-AAC website documentation template used.
